ROLLER

SELECTION GUIDE

Purchasing an inferior applicator for your project can be counter productive. Using low-quality applicators can prolong the job, cause frustration, and end up with unappealing results. Choosing the right applicator will help in being more efficient and has multiple benefits:

- Controlled even flow while painting
(will not dump the paint)
- Consistent fine finish
- Maximum paint coverage
- Product durability, for many uses
- Advanced cleanability
- Overall satisfying painting experience

CHOOSING THE RIGHT ROLLER

There are many different factors when choosing the right roller for your project. Rollers come in a variety of different fabrics, pile heights, and sizes. All fabrics have their own advantages and will give you different results.

It is critical to keep in mind the surface you are painting, this will determine the pile height needed to ensure you are working efficiently and accomplishing exceptional results. Rollers are the preferred tool when painting large surfaces. The following pages will explain which roller to use for your upcoming project.

BENEFITS OF CHOOSING QUALITY

Choosing a premium quality roller cover has many benefits. A premium roller cover works more efficiently. They will pick up more paint per dip allowing for more coverage. Premium rollers are also have the perfect amount of density, giving an exceptional finish.

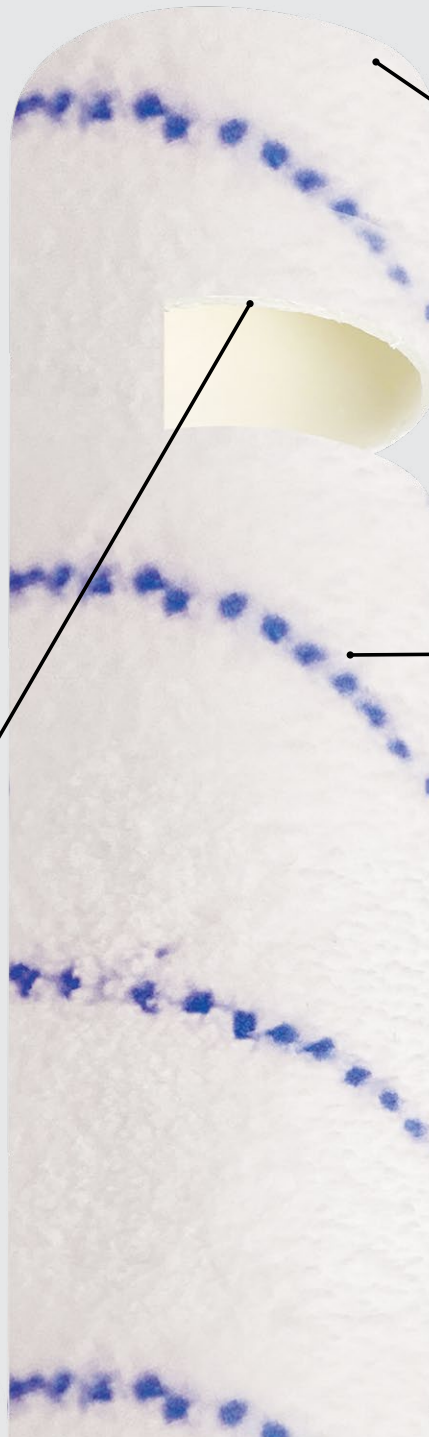

ANATOMY OF A ROLLER

ROLLER CORE

SOLID CORE

A solid core will hold its shape for multiple uses. ALL Pintar rollers are made with polypropylene cores. Polypropylene is moisture and solvent resistant and can be used with harsh applications that would normally melt a standard PVC core.

BEVELED EDGES

BEVELED EDGES

Make sure the edges are beveled. If the edges of the roller are not beveled, the roller fabric will lap over and cause feather marks on the wall while painting.

FABRIC

FABRIC

Make sure the fabric is not shedding. A light pull to check that the fibers don't come off easily. The roller fabric should feel dense, but not too dense. If the fabric is too dense, it will be difficult for roller to pick up and release paint.

Note: We always recommend to rub the roller sleeve briskly to remove any loose lint picked up from cutting and beveling the rollers during the manufacturing process

ROLLER FABRIC

There are a variety of different roller fabrics that are all unique in their own way. All fabrics offer their own advantages. Choosing the right fabric will depend on your project.

MICROFIBER

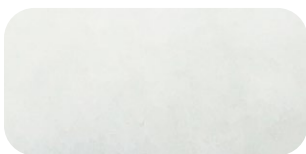

Microfiber is a thick fiber, woven fabric. The advantage microfiber rollers have is paint coverage. Thicker fibers allow the fabric to open up for maximum paint pick up and release resulting in painting much faster. The density of this fabric also provides an excellent quality finish.

ADVANTAGE HIGHLIGHT:
Maximum paint coverage with excellent finish

WOVEN FABRICS

WOVEN *Lint Free*

A traditional woven fabric is made using thinner fibers. Traditional woven rollers in Canada are commonly referred to as "lint free". The advantage woven rollers have is providing the finest finish. Thinner fibers make the roller more dense giving you an exceptional finish, but take away the ability to give the coverage a microfiber roller will give you. Woven roller covers are also much easier to control.

ADVANTAGE HIGHLIGHT:
Finest finish, controlled even paint flow

WOVEN FABRICS

KNIT

Knit fabrics hold and release the most paint. The fibers are loosely knitted allowing the fabric to open up for maximum paint pick up and release. The disadvantage knit fabrics is they leave behind some stipple, do not leave a great finish like woven fabrics. Knit rollers are mainly used when projects are using low luster paints.

ADVANTAGE HIGHLIGHT:
Maximum paint coverage

KNITTED FABRICS

ROLLER SIZE

Choosing a roller size is a simple matter of matching it to the size of your surface. However, you should also consider the increased fatigue involved when using a larger, heavier tool.

MINI

Used for small areas. Ideal for trim, walls, room corners, cupboards, cabinets, closets, doors, shelves and other hard-to-reach places

JUMBO CORE MINI ROLLERS

Larger roller core that fits on a frame allows for a true spin and eliminates any "dragging" once paint is on the roller. Used for small areas. Ideal for trim, walls, room corners, cupboards, cabinets, doors, shelves and other hard-to-reach places

9.5in (240mm)

Standard roller size. Ideal for painting walls, ceilings, and wood.

14in & 18in (356mm & 457mm)

For any large application. Ideal for floors or any uninterrupted spaces.

PILE HEIGHT

Pile height refers to the thickness of the roller cover. The surface you are painting will determine the rollers pile height. Choosing the right pile height is critical, allowing your project to be more efficient with desired results.

Using a higher pile height on smooth surfaces can cause a uneven, textured finish. Low pile height rollers can not release enough paint needed when filling crevices of a rough surface. A rough surface can also be very damaging to a lower pile height roller.

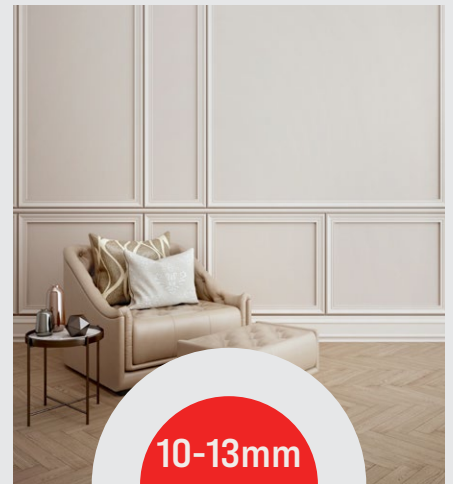

VERY SMOOTH

*For metal and plaster
Hi-Gloss paints*

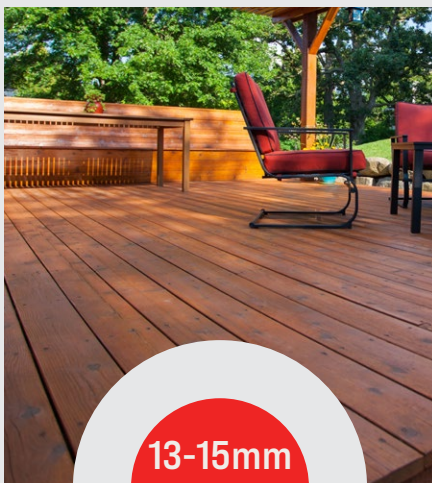

SMOOTH

*For metal, plaster, smooth wood
Semi-Gloss, Satin or Eggshell paints*

SEMI-SMOOTH

*For drywall, walls, and ceilings
Semi-Gloss, Satin or
Eggshell paints, stains*

SEMI-ROUGH

*For drywall, textured walls,
decks, and concrete
Semi-Gloss, Satin or Eggshell,
Matte & Flat paints, stains*

ROUGH

*For textured ceilings, rough wood,
stucco, decks and acoustic tile
Matte & Flat paints, stains*

VERY ROUGH

*For textured ceilings, stucco, brick,
concrete block, and fences
Matte & Flat paints*

PREMIUM

MICROFIBER

MICROFIBER

Pintar's premium blue stripe microfiber roller covers are made with a high capacity, European woven fabric that is designed to pick up and release more paint than other rollers on the market, allowing you to finish paint projects faster. This professional grade roller cover produces a superior one coat coverage while giving an excellent quality finish. This roller has excellent durability and is easy to clean for re-use.
